

Change between players

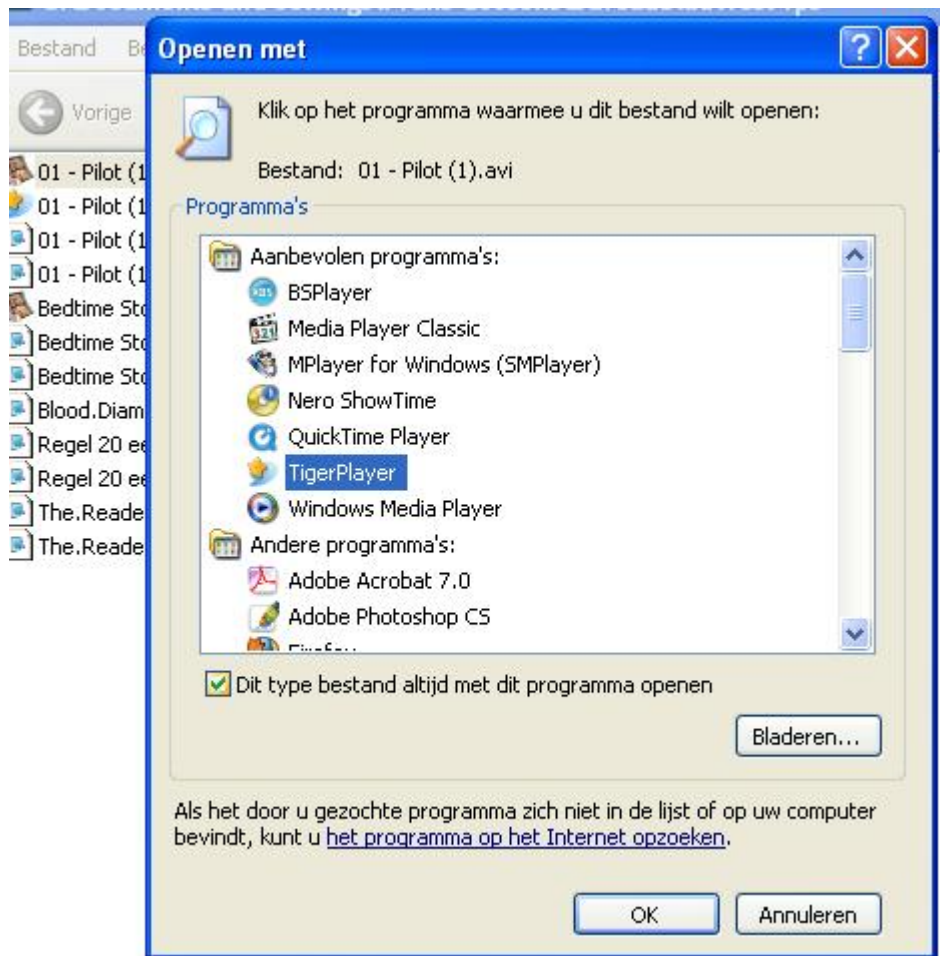

You determine what player you use. But with the program "Improving srt file" you must definitely use the MpcStar player (Only Version 4.1). The reason is that the program times and the text of this player can change while the movie runs. Some people think once you have installed a player you stuck to that player. Now that is not. With the changing of players we first practice to get familiar with this. We already have a player in the operating system. Now you must download and install the MpcStar Player.

<http://www.gratissoftwaresite.nl/testlab/Verbeteren+srt+files+ondertiteling>

When you install this player usually is asking whether the player should be the default player. Here you check in no. If you didn't, then there is nothing wrong. Afterwards you can always change it. Now we link avi files to the MpcStar Player. Go to an .avi file and press it with the right mouse button. Now a shortcut menu opens.

The Tiger player on top is our MpcStar player. If you choose that, it works only this time. If you want it always therefore we click the left mouse button on "Choose Program ...". See next picture.

Here you select Tiger player and check to "This file type always open this program". So here you determine what a player. avi file is opened. If you press OK, then always the TygerPlayer is started when you press on an avi movie. Would you change this, you must do the same but only select another player. Change it a few times so you become familiar with this and check if it works

The same story when you opened a srt file with the notepad. The notepad which is in Windows is capable of doing that. Make this possible in the way as described above.

The above is for an XP operating system. Vista will probably have a similar course of action. You should find out for yourself here.
